The output of a pressure switch is a digital on-and-off signal. This signal can only have two states on and off. The output of a pressure transmitter, however, is an analog electrical voltage or a current signal representing the pressure range sensed by the transducer. So the main difference between a pressure switch and a pressure transmitter is the type of output signal.

The series MS Magnesense® Differential Pressure Transmitter is an extremely versatile transmitter for monitoring pressure and air velocity. This compact package is loaded with features such as, field- selectable English or metric ranges, field- selectable LED display, selectable operating point of output signal.

The Transmitter module consists of three pins namely Vcc, Din and ground as shown above. The Vcc pin has a wide range from 9mA and can go as high as 40mA during transmission. The center pin is the data pin to transmit the signal.

If you are connecting the PX409 milliamp output pressure transducer to the DP400TP fast-response process meter, you’d need to refer to the user manual that came with the meter. The DP400TP can also serve as a power supply, providing the 12 V or additional 20 V DC needed to drive the PX409 unit.
